

IN THE CLAIMS

Please replace claim 1 as rewritten below:

sub
P
sub
C2
1. (amended) In an MPEG information distribution system, a method for forming a transport stream having a bitrate BR and including one or more programs, said method comprising the steps of:

defining N slots within said transport stream, where N is an integer, each of said N slots being associated with a respective plurality of non-contiguous transport packets, each of said respective non-contiguous transport packets being separated by N-1 transport packets;

including, within said transport stream being formed, up to N transport encoded programs, where each transport encoded program is associated with one of said N slots and has a bitrate of BR/N ; and

in the case of less than N transport encoded programs being included within said transport stream being formed, including NULL transport packets within said transport stream being formed, said NULL packets forming NULL programs within said transport stream being formed.

Al
2. (amended) The method of claim 1, wherein including NULL transport packets within said transport stream being formed comprises the steps of:

(1) examining a packet received from said transport stream to determine if said received packet comprises a NULL packet;

(2) inserting, into an output transport stream, a replacement packet if said received packet does comprise a NULL packet; and

(3) inserting, into said output transport stream, said received packet if said received packet does not comprise a NULL packet.

3. (amended) The method of claim 2, wherein said replacement packet is only inserted into said output transport stream if a timing condition is satisfied.

A6
Cont. 4. (amended) The method of claim 1, further comprising the step of replacing said one or more programs from said transport stream.

Please add new claims 6-11 as follows:

6. The method of claim 4, wherein the step of replacing said one or more programs comprises the steps of:

(1) examining a packet received from said transport stream to determine if a slot associated with said received packet corresponds to an insertion slot for said program to be inserted;

(2) inserting, into an output transport stream, a next packet of said replacement program if said slot associated with said received packet corresponds to an insertion slot for said program to be inserted;

(3) inserting, into said output transport stream, said received packet if said slot associated with said received packet does not correspond to an insertion slot for said program to be inserted; and

(4) repeating steps (1) through (3) for each packet of said transport stream until a replacement stream has been fully inserted into said output transport stream.

7. An apparatus for generating N programs, where N is an integer, to produce a slotted transport stream respectively having N slots, comprising:

a transport clock source CLK;

N transport encoders for respectively receiving said N programs and producing N program streams;

a frequency divider coupled between the transport clock source and the respective N transport encoders to divide a timing signal CLK from said transport clock source into N timing signals; and

a multiplexer, coupled to an output of said N transport encoders, for sequentially multiplexing one transport packet from each respective transport
